                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Produced Therefrom
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PF-0362 US
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 4, Application US/09166412
Patent No. 6133504
GENERAL INFORMATION:
APPLICANT: Wayne D. Loescher,
APPLICANT: John D. Everard
APPLICANT: Rebecca Grumet
TITLE OF INVENTION: DNA Encoding P
TITLE OF INVENTION: 6-Phosphate Re;
TITLE OF INVENTION: And Recombinat
TITLE OF INVENTION: Produced There
                                                                                                                                                                                                                                                                                                                                                                                                                          CLASSIFICATION:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

AAF71753 to AAF72330 encode the Corynebacterium glutamicum metabolic pathway (MP) proteins given in AAB79634 to AAB80211. The C. glutamicum MP nucleic acids are useful for the production of fine chemicals in microorganisms, including organic acids, nonproteinogenic amino acids, purine and pyrimidine bases, nucleosides, nucleosides, saturated and unsaturated fatty acids, diols, carbohydrates, aromatic compounds, vitamins, cofactors, polyketides and enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acids from Corynebacterium glutamicum encoding metabolic pathway proteins, useful for producing fine chemicals in microorganisms, including organic acids, nonproteinogenic amino acids, and purine and pyrimidine bases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Schroeder H, Zelder O, Haberhauer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 20; Page 228-229; 1737pp; English.

   ö
                                          This sequence is the LysG protein product, a lysine export regulator. LysG and LysE encode a lysine transport regulatory protein and an export protein, respectively. Microbial production of amino acids (A) is improved by increasing the export-carrier activity and/or the export gene expression in a microorganism that produces (A). The method is specifically used to increase production of lysine, used as an animal feed additive. Other (A) are variously useful as plarmaceuticals, condiments and intermediates for fine chemicals. This method increases the amount of (A) secreted into the culture medium. Export of (A) has been found to depend on a single gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Corynebacterium glutamicum; metabolic pathway protein; MP protein; fine chemical production; microorganism; organic acid; nucleoside; nonproteinogenic amino acid; purine base; pyrimidine base; nucleotide; lipid; saturated fatty acid; unsaturated fatty acid; diol; vitamin; carbohydrate; aromatic compound; cofactor; polyketide; enzyme.

insects. Blosynthesis of spinosyns occurs via stepwise condensation and insects. Blosynthesis of spinosyns occurs via stepwise condensation and insects. Blosynthesis of spinosyns occurs via stepwise condensation and additication of carboxylic acid precursors generating a linear polyketide which is modified further. The DNA sequence contains a central region of approximately 55kb which has homology to the DNA encoding the polyketide synthases (FKS) of known macrolide producers. The spinosyn PKS DNA region consists of 50 Known macrolide producers. The spinosyn PKS DNA region consists of 50 Known mitiator module, spnA, and several carted modules spnB-spnE. The products of the genes present in the region upstream of the PKS genes have been assigned names spnB-spnS region upstream of the PKS genes have been assigned names spnB-spnS region upstream of spnS, producting polypeptides and are responsible for different modifications in spinosyn blosynthesis. There are also two ORFS ORFLIS and ORFLIS free producing polypeptides AAY39318 '139319' it is suggested that the ORFLIS producing polypeptides AAY39318 '139319' it is suggested that the ORFLIS producing polypeptides AAY39318 '139319' it is suggested that the ORFLIS producing polypeptides AAY39318 '139319' it is suggested that the ORFLIS producing polypeptides AAY39318 '139319' it is suggested that the ORFLIS producing polypeptides AAY39318 '139319' it is suggested that the ORFLIS producing polypeptides AAY39318 '139319' it is suggested that the ORFLIS producing polypeptides AAY39318 '139319' it is suggested that the ORFLIS producing polypeptides and series are useful to improve yields of spinosyns, and for creating new spinosyns e.g. by mutagenesis, or interruption of steps in spinosyn biosynthesis. The modified spinosyns may be a new insect control agent or serve as substrates for further chemical modification and the creation of new semi-synthesic spinosyns. The genes are also useful to isolate similar sequences from S. spinosa or other species by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              118 LTLRLEDEAHTLSLLR--RGDVLGAVTREANPVAGCEVVELGTMRHLAIATPSLRDAYMV 175

                                                                                                                                                                                                                                                 activator gene. The single activator gene is incorporated in novel plasmid pANT195 (see AAV01451) that also includes the snpk-activated snph promoter and a modified doxA gene (see AAV01447) of Streptomyces sp. strain C5. The doxA gene codes for daunomycin C-14 hydroxylase (see AAW36128), an enzyme capable of converting daunomycin to the anticancer agent doxcrubicin. Host cells, especially Streptomyces host cells, transformed with pANT195 daunomycin or for the hydroxylation and oxidation of other

The present sequence is encoded by a fragment of pANT1201. This plasmid was used as a source of snpk, snph promoter, and multiple cloning site. The specification describes a method for the production of soluble, recombinant human endostatin in Streptomyces. Leader sequences of streptomyces sp. strain C5 Snph and S. venezuelae alpha-amylase proteins are linked to the N-terminal of endostatin. This ensures that endostatin protein is produced as a secreted, soluble protein which needs no refolding, is stable in the fermentation broth and is produced in large quantities. The method is used for preparing soluble recombinant human, murine or primate endostatin, which is useful in the treatment of cancer, inhibition of tumour growth, inhibition of angiogenesis, isolation of encounted compounds in assays. The endostatin protein is produced as a secreted, soluble protein which needs no refolding, is stable in the fermentation broth and is produced in large quantities. Streptomycetes are amenable for cultivation in large fermentations allowing for large quantities of soluble endostatin to be produced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              279
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   65 QAARKMVL----LQAETKAQLSGRLAEIPLTIAINAD-SLSTWFPPVFNEVASWGGATLT 119

                                                                                                              ŏ
                                                                                                                                    d
                                                                                                                                                             ò
                                                                                                                                                                                    g
                                                                                                                                                                                                                                                               AAE53015 to AAE54536, AAE54577 to AAE54615, and AAY74253 to AAY5941 and polypeptides. AAE54576 and AAE54616 to AAE5473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                             Neisseria meningitidis; Neisseria gonorrheae; antigen; vaccine; antigenic; diagnosis; immunogenic; infection; meningitis; septicaemia; antibacterial; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Masignani V, Mora M;

represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ5453 to AAZ54576 and AAZ54616 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as manufacture of medicaments for treating or preventing in the neisserial bacteria (e.g. meningitis and septicaemia), to detect the

P. aeruginosa is an opportunistic human pathogen present in soil water and plants. The specification describes virulence polypeptides and nucleic acid sequence encoding bylypeptides. These sequences can be used to identify a compound which is capable of decreasing the expression of a pathogenic virulence factor. Compounds that inhibit the expression or activity of virulence factor polypeptides can be used to treat pathogenic infections, especially where the infection is a P. aeruginosa infection.
presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.

The present sequence represents a narbonolide synthase subunit 4

(PICAIV). The nucleotide sequence encoding it is used in the course of the invention. The specification describes a recombinant bank compound expressing recombinant polyketide synthase genes in host cells for the production of narbonolide, narbonolide derivatives and polyketides that are useful as antibiotics and as intermediates in the synthesis of compounds with pharmaceutical value. The DNA compounds may also encode a C12-hydroxyalse (picK), desosamine biosynthesis and desosaminyl cransferase enzymes (useful for conversion of ketolides to antibiotics), and the beta-glucosidase enzyme (involved in picromycin biosynthesis). These compounds are also useful for increasing the antibiotic activity of a compound relative to the unhydroxylated compound. The recombinant of a compound relative to the unhydroxylated compound. The recombinant of the narbonolide polyketide synthase. These would be valuable for the narbonolide polyketide synthase. These would be valuable for creating novel ketolide analogs for pharmaceutical applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             14;
New recombinant pick hydroxylase gene of Streptomyces venezuelae useful for converting ketolides to antibiotics and as antibiotics and intermediates in the synthesis of compounds with pharmaceutical value
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          142

Streptomyces venezuelae ATCC15439.

The INVELLOR ITERATES to an ISOLATER and pullicating and comprising a desocamine biosynthetic gene cluster, a fragment or its biologically active variant, where the nucleic acid sequence is not derived from the eryc gene cluster of Saccharopolyspora erythraea or Streptomyces antibioticus. The invention also relates to a macrolide biosynthetic gene cluster, or fragments thereof. The macrolide biosynthetic gene cluster are combination of these compounds. Recombinant or augmented cells comprising the desosamine and/or macrolide biosynthetic gene clusters are useful for the decomposition of biologically active macrolides. The macrolide biosynthetic gene clusters are useful for the compounds are useful for synthesis of methymycin, pikromycin, pikromycin, pikromycin, neomethymycin and narbomycin. The alternative termination of polyketide production of biologically active macrolides. The macrolide biosynthetic cyprotesis may be useful to prepare novel antibiotics and polyketide synthesis may be useful to prepare novel antibiotics and polyhydroxyalkancate (PHA) monomers. The compounds produced by the recombinant host cells are useful as biopolymers, e.g., in packaging or biologically active agents, such as chemotherapeutics.

C biomedical applications, to engineer PHA monomer synthases or to prepare to biologically active agents, such as chemotherapeutics.

C biomedically active agents or macrolide-based antibiotics which are active against a variety of organisms, e.g., bacteria, including multi-drug resistant pneumococci and other respiratory pathogens, as well as viral parasitic pathogens, or as crop protection agents (e.g., as viral parasitic pathogens, or as crop protection agents (e.g., as viral parasitic pathogens, or as crop protection agents (e.g., as viral parasitic pathogens, or as crop protection agents (e.g., as viral parasitic pathogens, or as crop protection agents (e.g., as viral parasitic pathogens, or as crop protection agents (e.g., as traptomyces venezuelae ATCC 15439, which are encoded by sequences e .g. purified nucleic acid segment 69 -KMVLLQ-------AETKAQLSGRLAEIPLTIAINADSLSTW------745 ariipvdyashsahvetieneladvlaglspqtpqvpffstle----gtwitepaldggy -----FPPVFNEVASWGGAT------LTLRLEDEAHTLSLLRRGDVLGAVT 801 wyrn1rhrvgfapavet1atdegfthfievsahpv1tmt1pdkvtg1at1rred-----------ggghrl---ttslaeawanglaldwasllpatgalspavpdlptya Desosamine and macrolide biosynthetic gene clusters, useful for, 6.8%; Score 99.5; DB 21; Length 1346; 20.9%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CCAIV protein sequence. The invention relates to recombinant DNA containing a coding sequence for a narbonolide polyketide synthase containing a coding sequence for a narbonolide polyketide synthase containing a coding sequence for a narbonolide polyketides are compounds synthesised from 2-carbon units through a series of condensations and subsequent modifications. Modular PKSs are responsible for the production of many antibiotics including picromycin. The narbonolide PKS consists of a loading module, six extender modules, and two thiolester domains. Four proteins make up the narbonolide PKS of PICAII, PICAII and PICAIV). PICAI includes extender modules and 4, PICAII includes extender modules and 4, PICAII includes extender module 6 and a type II thioesterase domain. The second type II thioesterase domain. The second type II thioesterase domain. The second type II thioesterase domain is found on the PICB protein. The nucleotide sequences encoding all of these proteins can be isolated in recombinant form the recombinant cosmid pKOS023-27 (see AAZ5001). Narbonolide is desosamine biosynthetic genes are also found in cosmid pKOS023-77. The recombinant biosynthetic genes are also found in cosmid pKOS023-77. The recombinant complex (or its derivatives) or other ketolides (particularly narbonolide (or its derivatives) or other ketolides (particularly recombinantly expressed in the same hosts) to polyketide antibiotics or their intermediates. The antibiotics are useful in human or veterinary

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                õ
                                                                                                                                                                                                                                                                                                                                                                                                                                                         14;
biosynthetic gene cluster, or fragments thereof. The macrolide biosynthetic gene cluster encodes proteins which synthesise methymycin, pikromycin, neomethymycin, narbomycin or a combination of these compounds. Recombinant or augmented cells comprising the desosamine and/or macrolide biosynthetic gene clusters are useful for the production of biologically active macrolides. The macrolide biosynthetic proteins are useful for synthesis of methymycin, pikromycin, neomethymycin and narbomycin. The alternative termination of polyketide synthesis may be moromers. The compounds produced by the recombinant host cells are useful so biomedia produced by the recombinant host cells are useful as biopolymers, e.g., in packaging or biomedical applications, to as biopolymers produced by the recombinant host cells are useful as chemotherapeutics, immunosuppressants, agents to treat astima, chronic obstructive pulmonary disease as well as other diseases involving
                                                                                                                                                                                                                       respiratory inflammation, cholesterol-lowering agents or macrolide-based antibiotics which are active against a variety of organisms, e.g., bacteria, including multi-drug resistant pneumococci and other respiratory pathogens, as well as viral parasitic pathogens, or as crop protection agents (e.g., fungicides or insecticides) via expression of encoded by the macrolide biosynthetic gene cluster (pik) from Streptomyces venezuelae ATCC 15439.

AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAX75941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54574 to AAZ54576 and AAZ54616 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves may also be used as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                  Ξ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 EVLVQAARKMVLLQAETKAQLSGRLAEIPLTIAINADSLSTWFPPV------FNE- 109

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents a Amycolatopsis mediterranel rifamycin synthesis gene cluster ORF B protein from the present invention. The DNA fragment comprises a DNA region involved directly or indirectly in the gene cluster responsible for rifamycin synthesis, including the adjacent DNA regions to the right and left which, by reason of their function in connection with rifamycin blosynthesis, qualify as constituents of this rifamycin gene cluster, and functional fragments, derivatives or constituents of these. The Amycolatopsis mediterranel rifamycin synthesis gene cluster DNA fragment can be used for producing rifamycin, rifamycin analogues or precursors. It can also be used for inactivating or modifying genes involved in ansamycin or rifamycin blosynthesis, The DNA can be used for constructing mutant rifamycin blosynthesis gene cluster has been partly or completely deleted. The DNA fragment can be used for assembling a library of polyketide.

Synthases, which can be used for assembling a library of polyketides. A hybridisation probe of the invention can be used for identifying DNA fragments involved in the biosynthesis of ansamycins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     15;

The functional irgB gene encodes a protein which acts as a positive regulator of irgA. IrgA functions as a V cholerae virulence factor. The sequence given shows a truncated irgB. This truncation of the sequence inhibts expression of a functional irgA gene product in the cell. This sequence can be used to transform V cholerae calls which can then be used to induce immunity to cholera in a mammal. These transformed cells can colonize the intestines of inoculated animals and may be combined with vaccines targeted at other illnesses to make a single multi-valent vaccine. The transformed cells have reduced virulence such that the inoculated animal is less likely to develop
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  EDEAHTLSLLRRGDVLGAVTREANPVAGCEVVELGTMRHLAIATPSL---RDAYMVDGKL 179

Patent No. 5356796

CENERAL INFORMATION:
APPLICANT: Keller, John W.
TITLE OF INVENTION: A Repressor Protein and Gene for Regulating
TITLE OF INVENTION: A Repression of Polypeptides and Its Use in the Preparation of TITLE OF INVENTION: 2,2-Dialkylglycine Decarboxylase of Pseudomonas Cepacia NUMBER OF SEQUENCES: 30
CORRESPONDENCE ADDRESS:
ADDRESSEE: Finnegan, Henderson, Farabow, Garrett & ADDRESSEE: Finnegan, Henderson, Farabow, Garrett & STREET: 1300 I Street, N.W., Suite 700
CITY: Washington
STATE: D.C.
COUNTRY: US

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. 5/2002.
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Artavanis-Tsakonas, Spyridon
APPLICANT: Busseau, Isabelle
APPLICANT: Usderich, Robert J.
APPLICANT: Warsuno, Kenji
TITLE OF INVENTION: DELTEX PROTEINS, NUCLEIC ACIDS, AND
TITLE OF INVENTION: ANTIBODIES, AND RELATED METHODS AND COMPOSITIONS
TITLE OF INVENTION: 23
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1948 -LLEASADANIQDNMGRTPLHAAVSADAQGVF-----QILIWNRATDLDARMHDGTTPL 2000

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
